

Timothy Logvin

Backend Developer

Minsk, Belarus • koalko99 • koalko101 • Koalko101

About Me

Junior Backend Developer specializing in Java and Spring Boot, with additional experience in Python. Worked with PostgreSQL, Kafka, Redis/Valkey, Docker, and REST APIs. Developed multi-service applications, asynchronous systems, and integrations with external services. Strong foundation in algorithms, concurrency, and object-oriented programming.

Education

ISEI BSU, Bachelor's Degree in Information Systems and Technologies Sept 2024 – present

Algorithms and Data Structures (T-Education), Additional Education in Algorithms and Data Structures Jan 2025 – July 2025

- Studied algorithms, data structures, and algorithmic problem-solving techniques.

T-Academy, Additional Education in Java Backend Jan 2025 – present

- Hands-on study of Java, Spring Boot, SQL, testing, Docker, and backend service architecture.

Projects

Link-Tracker

Distributed Java backend system for asynchronous link monitoring and event processing

- Designed a 3-service Spring Boot architecture with asynchronous communication via Kafka between Bot, Scrapper, and AI Agent services.
- Implemented PostgreSQL persistence, Valkey caching, retry mechanisms, and DLQ for reliable message processing.
- Containerized the system with Docker Compose and developed integration tests for component interactions.

PS Store Tracker

Asynchronous Python application for monitoring products and prices in the PlayStation Store

- Developed an asynchronous HTTP client with retry logic, proxy rotation, and structured error handling.
- Implemented a layered architecture separating the HTTP client, parser, business logic, and CLI.
- Added automated tests with pytest, code quality checks with Ruff, and Docker support.

ISEI Schedule

Python service for automated university schedule retrieval and delivery through a Telegram bot

- Developed an asynchronous parser and Telegram bot for retrieving personalized schedules for students and instructors.
- Implemented local schedule storage to provide access to previously retrieved data when the source website is unavailable.
- Automated data retrieval, processing, and structuring using asyncio and HTTP requests.

Fractal Flame

Multithreaded Java application for generating fractal images

- Implemented single-threaded and multithreaded image generation with configurable parallel execution.
- Developed 13 nonlinear transformations, symmetry operations, gamma correction, and PNG output.
- Added CLI/JSON configuration, input validation, and automated tests with Maven.

Technical Skills

Languages: Java, Python, SQL

Backend: Spring Boot, Spring WebFlux, Spring Data JPA, Spring Data JDBC, Spring Security, REST APIs, asyncio, FastAPI, Flask, Quart

Databases and Messaging: PostgreSQL, Cassandra, MongoDB, Redis/Valkey, Kafka, gRPC

Testing: JUnit 5, pytest, WireMock, JaCoCo

Tools: Docker, Docker Compose, Linux, Git, GitHub, Maven, Ruff

Career Objective

Seeking an internship or Junior Java Backend Developer position where I can apply my Spring knowledge and grow in building reliable and scalable backend systems. Also open to Junior Python Backend Developer opportunities.

Certificates

Algorithms and Data Structures — T-Education
